### PRINCIPLE

#### INTENDED USE

TG reagent, when used in conjunction with SYNCHRON LX®, UniCel® DxC 600/800 System(s) and Synchron® Systems Multi Calibrator, is intended for quantitative determination of total Triglycerides concentration in human serum or plasma.

#### CLINICAL SIGNIFICANCE

Triglyceride measurements are used in the diagnosis and treatment of patients with diabetes mellitus, nephrosis, liver obstruction, other diseases involving lipid metabolism, or various endocrine disorders.

#### METHODOLOGY

Triglycerides GPO reagent is used to measure the triglycerides concentration by a timed endpoint method.¹,²

Triglycerides in the sample are hydrolyzed to glycerol and free fatty acids by the action of lipase. A sequence of three coupled enzymatic steps using glycerol kinase (GK), glycerophosphate oxidase (GPO), and horseradish peroxidase (HPO) causes the oxidative coupling of 3,5-dichloro-2-hydroxybenzenesulfonic acid (DHBS) with 4-aminoantipyrine to form a red quinoneimine dye.

The SYNCHRON® System(s) automatically proportions the appropriate sample and reagent volumes into the cuvette. The ratio used is one part sample to 100 parts reagent. The system monitors the change in absorbance at 520 nanometers. This change in absorbance is directly proportional to the concentration of TG in the sample and is used by the System to calculate and express the TG concentration.
CHEMICAL REACTION SCHEME

(a) Triglycerides $\xrightarrow{\text{Lipase}}$ Glycerol + Fatty Acids
(b) Glycerol + ATP $\xrightarrow{\text{GK}, \text{Mg}^{++}}$ Glycerol-3-phosphate + ADP
(c) Glycerol-3-phosphate + O$_2$ $\xrightarrow{\text{GPO}}$ Dihydroxyacetone + H$_2$O$_2$
(d) 2H$_2$O$_2$ + 4-Aminoantipyrine + DHBS $\xrightarrow{\text{HPO}}$ Quinoneimine Dye + HCl + 2H$_2$O

SPECIMEN

TYPE OF SPECIMEN

Biological fluid samples should be collected in the same manner routinely used for any laboratory test. Freshly drawn serum or plasma are the preferred specimens. Acceptable anticoagulants are listed in the PROCEDURAL NOTES section of this chemistry information sheet. Whole blood or urine are not recommended for use as a sample.

SPECIMEN STORAGE AND STABILITY

1. Tubes of blood are to be kept closed at all times and in a vertical position. It is recommended that the serum or plasma be physically separated from contact with cells within two hours from the time of collection.

2. Separated serum or plasma should not remain at room temperature longer than 8 hours. If assays are not completed within 8 hours, serum or plasma should be stored at +2°C to +8°C. If assays are not completed within 48 hours, or the separated sample is to be stored beyond 48 hours, samples should be frozen at -15°C to -20°C. Frozen samples should be thawed only once. Analyte deterioration may occur in samples that are repeatedly frozen and thawed.

Additional specimen storage and stability conditions as designated by this laboratory:

SAMPLE VOLUME

A filled 0.5 mL sample cup is the optimum volume. For optimum primary sample tube volumes in primary tube samples and minimum volumes, refer to the Primary Tube Sample Template for your system.

CRITERIA FOR UNACCEPTABLE SPECIMENS

Refer to the PROCEDURAL NOTES section of this chemistry information sheet for information on unacceptable specimens.

Criteria for sample rejection as designated by this laboratory:
PATIENT PREPARATION

It is recommended that blood specimens be drawn after the patient has fasted for 12 hours.

Special instructions for patient preparation as designated by this laboratory:

SPECIMEN HANDLING

Special instructions for specimen handling as designated by this laboratory:

REAGENTS

CONTENTS

Each kit contains the following items:
Two TG Reagent Cartridges (2 x 300 tests)

VOLUMES PER TEST

REACTIVE INGREDIENTS

REAGENT CONSTITUENTS

Lipase 93 U/L  
Adenosine triphosphate (ATP) 2.52 mmol/L  
Glycerol kinase (GK) 4 KIU/L  
Glycerophosphate oxidase (GPO) 1.1 KIU/L  
4-Aminoantipyrine 0.71 mmol/L  
3,5-Dichloro-2-Hydroxybenzenesulfonic Acid (DHBS) 1.54 mmol/L  
Horseradish peroxidase (HPO) 9 KIU/L  
Also non-reactive chemicals necessary for optimal system performance.

⚠️ CAUTION  
Sodium azide preservative may form explosive compounds in metal drain lines. See National Institute for Occupational Safety and Health Bulletin: Explosive Azide Hazards (8/16/76).

MATERIALS NEEDED BUT NOT SUPPLIED WITH REAGENT KIT

Synchron® Systems Multi Calibrator  
At least two levels of control material  
Saline

REAGENT PREPARATION

1. Qualitatively transfer all the contents of compartment C (smallest compartment) into compartment A (largest compartment).

2. Replace cartridge caps and gently invert the cartridge several times to ensure adequate mixing.

ACCEPTABLE REAGENT PERFORMANCE

The acceptability of a reagent is determined by successful calibration and by ensuring that quality control results are within your facility’s acceptance criteria.

REAGENT STORAGE AND STABILITY

TG reagent, when stored unopened at +2°C to +8°C, will remain stable until the expiration date printed on the cartridge label. Once prepared, the reagent cartridge is stable for 30 days at +2°C to +8°C unless the expiration date is exceeded. DO NOT FREEZE.
CALIBRATION

CALIBRATOR REQUIRED

Synchron® Systems Multi Calibrator

CALIBRATOR PREPARATION

No preparation is required.

CALIBRATOR STORAGE AND STABILITY

Synchron® Systems Multi Calibrator is stable until the expiration date printed on the calibrator bottle if stored unopened at -15°C to -20°C. Once opened, resealed calibrators stored at +2°C to +8°C are stable for 20 days unless the expiration date is exceeded.

⚠️ CAUTION

Because this product is of human origin, it should be handled as though capable of transmitting infectious diseases. Each serum or plasma donor unit used in the preparation of this material was tested by United States Food and Drug Administration (FDA) approved methods and found to be negative for antibodies to HIV and HCV and nonreactive for HbsAg. Because no test method can offer complete assurance that HIV, hepatitis B virus, and hepatitis C virus or other infectious agents are absent, this material should be handled as though capable of transmitting infectious diseases. This product may also contain other human source material for which there is no approved test. The FDA recommends such samples to be handled as specified in Centers for Disease Control's Biosafety Level 2 guidelines.5

Calibrator storage location:

---

CALIBRATION INFORMATION

1. The system must have a valid calibration curve in memory before control or patient samples can be run.

2. Under typical operating conditions the TG reagent cartridge must be calibrated every 14 days and also with certain parts replacements or maintenance procedures, as defined in the SYNCHRON LX Maintenance Manual and Instrument Log, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual. This assay has within-lot calibration available. Refer to the SYNCHRON LX Operations Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual for information on this feature.
3. For detailed calibration instructions, refer to the SYNCHRON LX Operations Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual.

4. The system will automatically perform checks on the calibration and produce data at the end of calibration. In the event of a failed calibration, the data will be printed with error codes and the system will alert the operator of the failure. For information on error codes, refer to the SYNCHRON LX Diagnostics and Troubleshooting Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual.

TRACEABILITY

For Traceability information refer to the Calibrator instructions for use.

QUALITY CONTROL

At least two levels of control material should be analyzed daily. In addition, these controls should be run with each new calibration, with each new reagent cartridge, and after specific maintenance or troubleshooting procedures as detailed in the appropriate system manual. More frequent use of controls or the use of additional controls is left to the discretion of the user based on good laboratory practices or laboratory accreditation requirements and applicable laws.

The following controls should be prepared and used in accordance with the package inserts. Discrepant quality control results should be evaluated by your facility.

TESTING PROCEDURE(S)

1. If necessary prepare reagent as defined in the Reagent Preparation section of this chemistry information sheet and load the reagent onto the system.
2. After reagent load is completed, calibration may be required.
3. Program samples and controls for analysis.
4. After loading samples and controls onto the system, follow the protocols for system operations.

For detailed testing procedures, refer to the SYNCHRON LX Operations Manual, or the UniCel DxC 600/800 System Instructions For Use (IFU) manual.

CALCULATIONS

The SYNCHRON® System(s) performs all calculations internally to produce the final reported result. The system will calculate the final result for sample dilutions made by the operator when the dilution factor is entered into the system during sample programming.
REPORTING RESULTS

Equivalency between the SYNCHRON LX and UniCel DxC 600/800 Systems has been established. Chemistry results between these systems are in agreement and data from representative systems may be shown.

REFERENCE INTERVALS

The Adult Treatment Panel of the Center for Disease Control (CDC) recommends triglyceride values for cardiovascular risk to be:6,7

Table 2.0 Triglyceride Reference Intervals

<table>
<thead>
<tr>
<th>CARDIOVASCULAR RISK</th>
<th>CONVENTIONAL UNITS</th>
<th>S.I. UNITS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Less than 150 mg/dL</td>
<td>Less than 1.95 mmol/L</td>
</tr>
<tr>
<td>Borderline high</td>
<td>150 – 199 mg/dL</td>
<td>1.95 – 2.59 mmol/L</td>
</tr>
<tr>
<td>High</td>
<td>200 – 500 mg/dL</td>
<td>2.60 – 6.49 mmol/L</td>
</tr>
<tr>
<td>Very high</td>
<td>Greater than 500 mg/dL</td>
<td>Greater than 6.50 mmol/L</td>
</tr>
</tbody>
</table>

Refer to Reference (8) for additional reference intervals according to age and sex. Each laboratory should establish its own reference intervals based upon its patient population.

Refer to References (9, 10, 11) for guidelines on establishing laboratory-specific reference intervals.

Additional reporting information as designated by this laboratory:

PROCEDURAL NOTES

ANTICOAGULANT TEST RESULTS

1. If plasma is the sample of choice, the following anticoagulants were found to be compatible with this method based on a study of 20 healthy volunteers:

Table 3.0 Acceptable Anticoagulantsa

<table>
<thead>
<tr>
<th>ANTICOAGULANT</th>

<td>≤-80.0</td>
</tr>
</tbody>
</table>

a Data shown was collected using SYNCHRON CX Systems. Equivalency between SYNCHRON LX Systems has been established by Deming regression analysis to SYNCHRON CX Systems.
b Bias is based on worst case instead of average. Plus (+) or minus (-) signs in this column signify positive or negative bias.

LIMITATIONS

Samples at a Lipemia Index Level of 9 and above should be diluted one part sample plus nine parts saline prior to analysis. The result should be multiplied by ten or the factor entered into the system during sample programming. This should prevent falsely decreased results due to excessive turbidity.

INTERFERENCES

1. The following substances were tested for interference with this methodology:

Table 5.0 Interferences

</tbody>
</table>

a Data shown was collected using SYNCHRON CX Systems. Equivalency between SYNCHRON LX Systems has been established by Deming regression analysis to SYNCHRON CX Systems.
b Plus (+) or minus (-) signs in this column signify positive or negative interference.
c NA = Not applicable.

2. Refer to References (12,13,14) for other interferences caused by drugs, disease and preanalytical variables.

PERFORMANCE CHARACTERISTICS

ANALYTIC RANGE

The SYNCHRON® System(s) method for the determination of this analyte provides the following analytical ranges:

Table 6.0 Analytical Range

<table>
<thead>
<tr>
<th>SAMPLE TYPE</th>
<th>CONVENTIONAL UNITS</th>
<th>S.I. UNITS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serum or Plasma</td>
<td>10 – 1000 mg/dL</td>
<td>0.1 – 11.3 mmol/L</td>
</tr>
</tbody>
</table>

Samples with concentrations exceeding the high end of the analytical range should be diluted with saline and reanalyzed.
REPORTABLE RANGE (AS DETERMINED ON SITE):

Table 7.0 Reportable Range

<table>
<thead>
<tr>
<th>SAMPLE TYPE</th>
<th>CONVENTIONAL UNITS</th>
<th>S.I. UNITS</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SENSITIVITY

Sensitivity is defined as the lowest measurable concentration which can be distinguished from zero with 95% confidence. Sensitivity for TG determination is 10 mg/dL (0.1 mmol/L).

EQUIVALENCY

Equivalency was assessed by Deming regression analysis of patient samples to accepted clinical methods.

**Serum or plasma (in the range of 20 to 997 mg/dL):**

\[
Y \text{ (SYNCHRON LX Systems)} = 0.957X + 2.40
\]

N = 68

MEAN (SYNCHRON LX Systems) = 276.6

MEAN (SYNCHRON CX7 DELTA) = 286.6

CORRELATION COEFFICIENT (r) = 0.999

Refer to References (15) for guidelines on performing equivalency testing.

PRECISION

A properly operating SYNCHRON® System(s) should exhibit precision values less than or equal to the following:

Table 8.0 Precision Values

<table>
<thead>
<tr>
<th>TYPE OF PRECISION</th>
<th>SAMPLE TYPE</th>
<th>1 SD mg/dL</th>
<th>mmol/L</th>
<th>CHANGEOVER VALUE* mg/dL</th>
<th>mmol/L</th>
<th>% CV</th>
</tr>
</thead>
<tbody>
<tr>
<td>Within-run</td>
<td>Serum/Plasma</td>
<td>5.0</td>
<td>0.1</td>
<td>166.7</td>
<td>2.0</td>
<td>3.0</td>
</tr>
<tr>
<td>Total</td>
<td>Serum/Plasma</td>
<td>7.5</td>
<td>0.2</td>
<td>166.7</td>
<td>2.0</td>
<td>4.5</td>
</tr>
</tbody>
</table>

* When the mean of the test precision data is less than or equal to the changeover value, compare the test SD to the SD guideline given above to determine the acceptability of the precision testing. When the mean of the test precision data is greater than the changeover value, compare the test % CV to the guideline given above to determine acceptability. Changeover value = (SD guideline/CV guideline) x 100.

Comparative performance data for a SYNCHRON LX® System evaluated using the NCCLS Proposed Guideline EP5-T2 appears in the table below. Each laboratory should characterize their own instrument performance for comparison purposes.
Table 9.0 NCCLS EP5-T2 Precision Estimate Method

</tr>
</tbody>
</table>

<sup>a</sup> The point estimate is based on the pooled data from one system, run for twenty days, two runs per day, two observations per run on an instrument operated and maintained according to the manufacturer’s instructions.

**NOTICE**

These degrees of precision and equivalency were obtained in typical testing procedures on a SYNCHRON LX<sup>®</sup> System and are not intended to represent the performance specifications for this reagent.

**ADDITIONAL INFORMATION**

For more detailed information on SYNCHRON LX Systems or UniCel DxC Systems, refer to the appropriate system manual.

**SHIPPING DAMAGE**

If damaged product is received, notify your Beckman Coulter Clinical Support Center.
