MaxDiscovery™ Alanine Transaminase (ALT) Enzymatic Assay Kit is intended for laboratory use only, unless otherwise indicated. This product is NOT for clinical diagnostic use. MaxDiscovery is a Trademark of Bioo Scientific Corporation (BIOO).
GENERAL INFORMATION

Product Description

The MaxDiscovery™ Alanine Transaminase (ALT) Enzymatic Assay Kit is a plate-based colorimetric enzymatic assay for the determination of the alanine transaminase enzyme in serum samples. Alanine transaminase (ALT) (also known as alanine aminotransferase or sGPT) is a metabolic enzyme expressed primarily in the liver. Damage to the liver causes the release of this enzyme into the blood. Elevation of ALT levels is an indication of liver damage and has been associated with liver injury. ALT levels are monitored routinely in patients with liver diseases. ALT is also a very useful tool for preclinical investigation of experimental drug formulations and ALT levels are commonly used to monitor and attenuate the hepatotoxic effects of experimental drugs in rodents.

The kit uses a spectrophotometric, kinetic assay to detect changes in alanine transaminase levels directly from serum samples. The unique features of the kit are:

- High sensitivity and low detection limit (20 U/L)
- A rapid (5 minutes), robust enzyme-based assay which does not require expensive instrumentation
- High reproducibility
- Only requires 10 μL of serum

Procedure Overview

The MaxDiscovery™ Alanine Transaminase (ALT) Enzymatic Assay Kit uses a coupled enzymatic reaction scheme: alanine and α-ketoglutarate are first converted to glutamate and pyruvate which is converted by lactate dehydrogenase to make lactate and NAD⁺. The conversion of the NADH chromophore to NAD⁺ product, measured at 340 nm, is proportional to the level of ALT enzyme in the sample. The absorbance of each well at 340 nm is measured using a plate reader. The concentration of ALT in each sample is then directly determined from the change in absorbance at 340 nm within 5 minutes time. Dilutions of the Pyruvate Control, included in the kit, can be used to construct a standard curve to calibrate the assay and confirm assay linearity. This is described in more detail in Section, “Data Analysis.”

Kit Contents, Storage and Shelf Life

The MaxDiscovery™ Alanine Transaminase (ALT) Enzymatic Assay Kit has the capacity for 96 determinations or testing of 42 samples in duplicate (using 12 wells for standards). The kit also contains enough material to construct four standard curves. Store the kit at 4°C. The shelf life of the kit is 12 months when properly stored. Once the Reagent Mix is reconstituted the shelf life of the kit is 3 months when properly stored. For more details, see “Preparation of Reagent Mix.”

Required Materials Not Provided With the Kit

- Microtiter plate reader (340 nm)
- Centrifuge (to prepare serum samples)
- Deionized or distilled water
- 1.5 mL microfuge tubes
- Multichannel pipet or repeating pipettor (Optional)

Warnings and Precautions

BIOO strongly recommends that you read the following warnings and precautions to ensure your full awareness of the techniques and other details you should pay close attention to when running the assays. Periodically, optimizations and revisions are made to the kit and manual. Therefore, it is important to follow the protocol included with the kit. If you need further assistance, you may contact your local distributor or BIOO at techsupport2@biooscientific.com.

- Do not use the kit past the expiration date.
- Try to maintain a laboratory temperature of (20–25°C/68–77°F). Avoid running assays under or near air vents, as this may cause excessive cooling, heating and/or evaporation. Also, do not run assays in direct sunlight, as this may cause excessive heat and evaporation. Cold bench tops should be avoided by placing several layers of paper towel or some other insulation material under the assay plates during incubation.
- Make sure you are using only distilled deionized water since water quality is very important.
- When pipetting samples or reagents into an empty microtiter plate, place the pipette tips in the lower corner of the well, making contact with the plastic.

SAMPLE PREPARATION

Serum

1. Carefully collect whole blood in a 1.5 mL microfuge tube or serum collection tube making sure to avoid hemolysis as it will release erythrocyte ALT enzyme into the serum.
2. Incubate the blood sample at 37°C for 10 minutes.
3. Centrifuge sample at 10,000 rpm for 10 minutes.
4. Remove serum layer to a clean tube avoiding the “buffy coat” layer.
5. Store serum samples on ice or at 4°C prior to testing; do not freeze samples. Serum samples can be stored at 4°C for up to one week.
6. Use 10 μL of serum in the assay.

BIOO shall not be liable for any damages, including special or consequential damage, or expense arising directly or indirectly from the use of this product.
Reagent Preparation

❖ Preparation of Reagent Mix

To reconstitute the Reagent Mix, add exactly 27 mL of deionized or distilled water to the Reagent Mix powder. Mix by swirling or inverting the bottle 10 times. Allow contents to dissolve for 10 minutes at room temperature.

IMPORTANT: The reconstituted Reagent Mix can be left at room temperature for short periods (30 – 60 min) prior to use. Between uses, the reconstituted Reagent Mix should be stored at 4°C (for up to 3 months). Discard the Reagent Mix 3 months after reconstitution.

To obtain higher sensitivity measurements use a temperature controlled plate reader, if available. Adjust the plate reader temperature control to 37°C and equilibrate the Reagent Mix to 37°C for 10 minutes before use.

❖ Preparation of Pyruvate Control Dilutions for Standard Curve (Optional)

Label six microfuge tubes: 1, 2, 3, 4, 5, Neg. Then make 6 serial dilutions of the Pyruvate Control (3 concentration increments per log) using the Pyruvate Dilution Buffer as described in the table below.

NOTE: There is enough material to construct 4 Standard Curves. Make the Pyruvate Control Dilutions for the Standard Curve fresh each time that the Standard Curve is performed. After each dilution, briefly mix the tube before performing the next dilution.

*Only needed for the generation of the Standard Curve.

Assay Protocol

1. Add 10 μL of each sample or standard (in duplicate) to the microplate wells.
2. Add 240 μL of Reagent Mix to the wells. (Using a multichannel pipet or repeating pipettor is recommended).
3. Immediately measure the absorbance of each sample at 340 nm. Exactly 5 min later, measure absorbance again.
**DATA ANALYSIS**

**Determination of Alanine Transaminase Activity in Serum Samples**

Using the supplied materials and the procedure described above (for measurements performed at 37°C), the concentration of ALT (units per liter) can be determined by multiplying the decrease in absorbance in 5 min by 1072.

For example, if an absorbance decrease of 0.1 is observed over the 5 min interval, the ALT enzyme concentration in the sample would be $1072 \times 0.1 = 107.2$ U/L.

**Standard Curve Construction (Optional)**

A calibration curve to confirm assay linearity can be constructed using the Pyruvate Control Dilutions as described below:

1. For each calibration point, calculate the *average absorbance change*. To do this, subtract the average 5 min absorbance value of each point from the average 5 min absorbance value of the "Neg" (no pyruvate) point. This calculation should include subtracting the average 5 min absorbance of the 'Neg' value from itself, which is approximately zero.

2. For each standard, plot the average absorbance change along the y-axis (from lowest in value to highest in value) and the inverse value of the relative dilution number* (i.e. 0.047, 0.1, 0.22, 0.47 and 1) on the x-axis. For Tube #6 (Neg) use "0".

![ALT Standard Curve](image)

*Relative dilution numbers can be found in the table on page 3.
